

Insect Spy Drone

TEAM CLAWS

Is this a mosquito? No. It's an insect spy drone for urban areas, already in production, funded by the US Government. It can be remotely controlled and is equipped with a camera and a microphone. It can land on you, and it may have the potential to take a DNA sample or leave RFID tracking nanotechnology on your skin. It can fly through an open window, or it can attach to your clothing until you take it in your home.

Such drones could make useful additions to the arsenal of security forces in their fight against insurgents and terrorists and to the police forces in bringing criminals to book.
